ENCODED TAG DATA INTERFACE

Encoded fixed data can be up to 120 bits long -Use 2 buffers to allow for 2 simultaneously

These stores hold the fixed tag data for 1 tag. READs in one cycle.

-Total memory = 120x2 = 240 bits

Encoded variable data can be up to 360 bits long -Use 2 buffers to allow for 2 simultaneously READs in one cycle. Use 2 buffers to allow for simultaneously -Total memory = 360x2x2 = 1280 bits -Min tag width = 126 dots READ/WRITE

so the fastest that 1 tag can be read = 126/2 = 63 cycles

-From the specification, we must be able to process 2 dots/cycle.

-Once all this data is loaded it will be valid for at least 126 lines.

-126 lines contains 20480x126 = 2580480 dots.

-Therefore the data will be updated at most every 1290240 cycles. -Total memory = 164x2x64 = 20992-bits

Once printing has started each half buffer has 1/2 a line in which to be loaded i.e. for a 12,8 inch line it has 10240 dots or 5120 cycles The store uses 9-bit addressing. Bit-9 indicates which buffer.

for an 8 inch line it has 6400 dots or 3200 cycles
